## MULTIPLE COPIES IN QUILL

Well I hooked up my print buffer to my QL to see if I could print multiple copies of articles using my 64K Micro Stuffer print buffer. I was hoping that this would also relieve the idea of having to wait for the print to finish, on long print jobs, before gaining access to the computer again. Well it worked. I now can load at least 8 pages from Quill to the printer and have the computer back before only two pages are printed. This is great as now I can write my article and while it is printing I can start on some thing else. It doesn't even have to be in Quill.

This works great for labels also. If the lables don't line up just stop the printer, realign them and push the repeat button on the buffer.

This setup also allows me to change print size and type. On my printer there is switches on the front that allow that. If I wish to buy a 36 pin A-B box I can tie the buffer to both my QL and TS2068. Then with a flip of a switch I can print from either computer with out having to turn off the printer and switch cables. I do recommend a print buffer for your set up even if you only use just the QL or just the TS2068. If you are looking for a print buffer you can check your local computer dealer. They probably will have one but the cost may be more than one from are Sinclair dealers. I got mine from RMG Enterprises. Check it out.

## **"SQ" NOTES**

BY R.A.HILSMANN

After a nice vacation in Europe, back to work! Vacations are never long enough it seems, but what prevents one from longer vacations is not the lack of time of course, but the lack of funds (what else is new?). Guess it would be nice to be rich!

What's new in Europe? Well, besides the fact that countries in Europe are more affluent then they have ever been, not much. The computer craze has shifted to IBM and IBM compatibles. Schneider seems to be the biggest name in compatibles, at least in Germany, where I spend most of my time. I looked around for signs of Sinclair, but couldn't even find a magazine that had mention of Sinclair computers in them. This may of course be different in Britain, but on the mainland in Europe this is not the case. Even in the past Comodore was better known than Sinclair, not much different as it is in this country, again don't forget I am talking about the mainland of Europe, not Britain.

I just aquired a RGB monitor for my QL computer, naturally, since I like to keep cost to a minimum, it is one of the cheapest one, a Franklin MC-1400TS, which I picked up for \$150. Of course, having a Sinclair computer, one does not just plug something like that in on the output port for such a device, but let me talk about what needs to be done to make it work on the QL since I could not find much about it in all the papers I had on the QL.

The Franklin monitor is configured to IBM standard, having a 9 pin D connector on the end of its input cable. Input on all pins on this D connector must also be IBM standard for RGB monitors.

In the next column the IBM standard inputs needed on the D connector:

Pin #1 = Ground  
Pin #2 = Ground  
Pin #3 = R(ed)  
Pin #4 = G(reen)  
Pin #5 = B(lue)  
Pin #6 = Intensity  
Pin #7 = Not connected  
Pin #8 = Horizontal Sync  
Pin #9 = Vertical Sync

All inputs have to be TTL, ( positive 0 to 5 volt ). The QL has all the above outputs, but horizontal sync (composite sync) is negative, therefore any IBM standard monitor will not work. There is a fix for that, the output on pin 4 of the DIN connector (on the QL) has to be inverted. This could be done by wiring an extra chip onto the cable, or much better, open your QL, and bend pin 12 of IC22 (ZX8301) out, so that it is not inserted into the socket. Pin 1 to 6 on the 74HC04 chip on the Spider Board, found siliconed onto the memory chips, are not used, solder two wires to either pin 1&2, 3&4 or 5&6, strip the other end of the wire coming from either pin 2, 4 or 6 a bit more than a quarter inch, fold the striped end, and insert it into the socket where pin 12 would normally be inserted. Re-insert the ZX8301 chip into its socket, making sure pin 12 is bend out, and does not make contact with the wire you inserted (also make sure the bend pin does not touch any pin on the 68008 chip next to it). Now solder the remaining wire from the 74HC04 chip to pin 12 of the ZX8301 chip.

This completes the conversion (after you have managed to put your QL back together) of your QL to IBM standard. Most RGB monitors on the market can now be connected to your QL. All the above of course is not necessary if you buy a Magnovox RGB monitor. Will your monitor still flicker in the monitor mode? Yes, if you look close the 50 cycle refresh is still noticeable, but not quite as bad, at least not on the Franklin. Perhaps after the outputs from the ZX8301 chips are buffered....?

If you do not have a RGB cable that has been made for the QL, you will need a 8 pin DIN connector, a 9 pin D connector (female), and a 6 wire cable. Connections are as follows:

D CONNECTOR	DIN CONNECTOR
PIN #1 ----->	PIN #2
PIN #2 ----->	PIN #2
PIN #3 ----->	PIN #7
PIN #4 ----->	PIN #6
PIN #5 ----->	PIN #8
PIN #6 ----->	NOT CONNECTED
PIN #7 ----->	NOT CONNECTED
PIN #8 ----->	PIN #4
PIN #9 ----->	PIN #5
CASE ----->	SHIELD

Further improvements to your QL should be made, such as to buffer the monitor output from the ZX8301, something I have not done at this time. There are more fixes for your QL to be found in the past issues of Quantum Levels (and I am sure in future issues).

Now let me talk about something else, I have been working on a new terminal program for the QL, sure there are some on the market, and I do have one I have used in the past called "QLTERM", nice program if you are into Bulletin Boards per Telephone, but I need one for Packet Radio! A different environment.

I also have the compiler "Turbo" available, which I had bought along with other software from a friend who decided to get into a 'better' computer! So, you guessed it, I been using this compiler to get my new terminal program to run faster, and also to multi-task.

Sounds easy enough doesn't it? Well, Turbo is a nice compiler, and comes along with a toolkit, which has a bucket full of new commands one can write a program with, fact is, some very powerfull commands, which really would make live a lot easier. Only one problem! The documentation is written in a language I

can not read, and I can read a few more than most people. It took me longer to find an explanation for some of the commands in the toolkit, and how to implement them, as to write the whole program itself. I had to read the manual over and over again to find out what they meant. It would be nice if someone would write a manual for the manual!!

Examples would have been nice to take over where the manual left off, or just a program written, using all new commands in their proper syntax, would have been more help. There are still a few commands, and their implementation, vital to the program I am writing, which I am not able to apply. Sure, after one knows, after a week of reading, compiling, testing etc. even this manual makes sense, but the writer forgot to write the manual for people who dont know.

Perhaps it would have helped to have used Supercharge, the compiler previously released by Digital Precision, because reference is made to commands previously implemented in Supercharge. Well enough, let me give you an example of one item quite important to running a Turbo compiled program. This is something which has eluded my trial and error method to this day, and I finally gave up. To explain what this is all about, let me fill you in; Turbo compiled programs need a toolkit runtime version to be present to work, if toolkit commands have been used within the compiled program. One such command is Link\_Load, which will link load multi tasking programs which rely on each other for certain data.

It reads:

Runtime command support

The runtime version allows developers to call toolkit routines from within compiled programs, but restricts interpretative use. All of the toolkit commands and functions are supported from within Super-

charged or Turbocharged code, with the exception of these compiler directives:

IMPLICIT%, IMPLICIT\$, EXTERNAL,  
GLOBAL, DATA\_AREA, REFERENCE,  
WHEN\_ERROR, END\_WHEN, SNOOZE,  
CHARGE, PROCEDURE, FUNCTION,  
OPTION\_CMD\$, ERLIN%, ERNUM%

These are all ignored by Supercharge and translated into compiler specific code by Turbo, so you may still use all of these features in commercial Turbocharged programs. You must have the standard Toolkit loaded when you compile programs using these words. The resultant task will run under runtime toolkit, even though the words are not defined.

In general any attempt to use Toolkit commands in interpreted BASIC when the runtime toolkit is loaded will cause a BAD PARAMETER or not IMPLEMENTED error report. However, to allow application to start up reasonably easily, the command-file keyword END\_CMD will work as normal, and EXECUTE/\_A/\_W and LINK\_LOAD/\_A/\_W will work if their only parameters are file name strings. Names must be in quotation marks and channel numbers, parameters and priorities are only supported in compiled programs. If these facilities are vital they must be provided through a startup task which loads others appropriately.  
End of text.

Is it clear? or is it what? Does this not mean that I can use the command LINK\_LOAD to load tasks from a BASIC loader? But tell me, what is a file name string, is it a name\$? is it a\$ which holds the name? Well whatever I had tried, it didn't work. I even wrote a startup task to LINK\_LOAD the other tasks, but no go. Well, this is only one example of how the manual has been written, nowhere is there an explanation of what a file name string is, and so it goes on and on. Maybe I'm not into computers long enough, or like I said before, it is written in a language I don't understand, sure looks like english though.

Other than the problem of interpreting the manual, it is an excellent compiler, fast when compiling, and fast when running the code. I compiled four task for the terminal program I wrote, and it works. I got around loading the run time version of toolkit by loading the standard version, but there were some toolkit commands in some routines I had added, which did not run, and my suspicion is, it is do to the absence of the run time version. The way out of such delemma? Delete the routine!

Yes, sooner or later I will become efficient in using this compiler, but wouldn't it be nice if one could look things up in the manual? I guess this is not the first or only manual written like that, but I have seen many, and this one ranks in the top ten when it comes to being hard to understand.

Well that's it for this month, I don't know what the next 50 NOTES will be all about, but I'll think of something.

till next month...R.A.H.

"A remarkable vaccine, Professor Steinmetz.  
But bear in mind that hamsters very seldom catch Dutch elm disease."

This program from SINCUS and Dave Schoenwetter will allow you to use a full size printer from your TS 2068, TS2050 modem and Smart Term II. It should work on most Epson compatible printers.

## PRINTERS AND QUILL

Setting up a printer in Quill is not a very difficult task. Although it can be time consuming. You start by LRUN INSTALL\_BAS from the Quill media. If using MDV then use that. FLP or any other device you should convert first. After LRUNing the program will ask for the device location. I am using disk so I used FLP1 and pressed enter. Now it asks for type of port. Standard serial (ser1 or ser2) or a parallel or other non-standard port. I use ser1 for my printer port. The program now begins loading the Editor program so you can change the print driver codes.

After loading the top portion of the screen contains the Edit control keys and their usage. The rest of the screen contains the current printer loaded and other printer types available. Using the UP/DOWN arrows move the cursor to the desired printer and press enter. If you don't want any of the pre-programmed entries choose other. If you choose OTHER press F2 to start editing the printer. Change the name to a meaningful one or change the

Port, Baud, Parity, Lines/page, Char./Line and/or any of the control code lines. Please note all necessary codes must be placed in one line. For example if the control code requires an escape code before the control code it must be on the line. If a number is to follow it must be there. Use commas to connect the codes. For example; 27,61,0. The 27 is the escape code, the 61 is a control code and the 0 is a modifier to the control code. Preamble - This is used to set up the printer prior to the start of printing. Postamble - What the printer should do after printing is completed. The rest are self-explanatory except for Translate. Translate codes go into effect when the ASCII code is embedded in the print line where required. What ever is the first in the translate string is the control code. When that code is encountered the Translate will take effect. If you use the ASCII code for the ^ then when ever ^ is encountered that translate series will take effect. You've 10 of them.

## TS2068 Utilities

This month the program ideas and hints are from T/S 2068 Basics and Beyond. I hope you find them useful.

This program is written to display the power of the "POINT" command. It will draw a maze; then check for walls with the POINT command, as you guide the dot through the maze with the arrow keys.

```
10 PLOT 0,10: LET d=40
15 FOR i=1 to 2: FOR n=1 to 12
20 READ a,b: DRAW a,b: NEXT n
25 PLOT 10,0:LET d=20:RESTORE:NEXT i
30 DATA 20,0,0,50,30,0,0,60,d,0,30,0
35 DATA
0,-30,20,0,0,-40,20,0,0,-20,30,0
40 LET x=5: LET y=5
45 PLOT x,y
50 IF INKEY$="" THEN GO TO 50
55 LET a$=INKEY$
60 LET px=x: LET py=y
65 IF a$="5" THEN LET x=x-1
70 IF a$="6" THEN LET y=y-1
75 IF a$="7" THEN LET y=y+1
80 IF a$="8" THEN LET x=x+1
85 IF POINT(x,y) THEN GO TO 100
90 PLOT OVER 1;px,py
95 GO TO 45
100 BEEP .25,1
105 LET x=px: LET y=py: GO TO 45
```

Lines 10 to 35 DRAWS a simple maze. Since the two lines are basically the same, the same DATA is used for each, beginning at a different PLOT point. The one segment in the middle must be of a different size for the top and bottom of the path, so a variable is placed in the DATA statement for it.

Lines 40 to 45 Puts a dot on the screen for steering through the path. Line 50 Waits for a key press.

Line 60 Saves the dot position in variables px & py for later erasure. Lines 65 to 80 Assigns new values to x and y in response to the key press.

Line 85 If the spot indicated by the new x,y coordinate already has an INK pixel, indicating you have bumped into a wall, then go to subroutine. Line 90-95 Erases the dot and loops back to print it in the new position.

Lines 100-105 If you have hit a wall, resets the x and y values to what they were before you pressed the cursor keys and loops back for another try.

**NEED

## PRESIDENTS MESSAGE

Well we are continuing with checking into the 1990 Sinclair Computer Fest and, will have a report at the August meeting. If you want to be involved **show up**. We will need hands for the digitizer board. Check out, assembly and what have you. I know it is summer but we only ask for a few hours of your time. The club project needs hands and help.

-Ham & Computer Swapfest, Sunday Oct. 15, 1989 Waukesha County Expo. \$2 in advance \$3 at the door. 7am to 1pm.

-Late Fall Ham Fest, Sunday Oct. 29, 1989 Lake County Fairgrounds, Rts. 45 & 20 Grayslake, IL. 7am to ?. \$3.

I have one question and that is why are there so few computers at the meeting? I know many of you are using them for exciting things and want to show them off. Well the meeting is your chance to preen your feathers and display your beauty. We need you to make a good meeting.

Thats it for now. See you Aug. 2nd.

## Garbage In Garbage Out Or In Otherwords The Meeting

With only 14 members in attendance the July meeting was called to order.

We discussed the Newsletter. It seems two members did not get their newsletter by the meeting date. The problem was the holiday, 4th of July, falling on Tuesday just prior to the meeting. Since there was no mail delivery everything got pushed back one day. Sorry people will try to avoid this problem in the future.

Dick reported that he will be picking up the Digitiser boards for the next meeting. So come prepared to pick up your board.

Bill reported on the mailing to vendors to find out if they were still selling Sinclair hardware/software and it seems many are still doing so and we have found a few new names. Keep checking the newsletter to find out who they are.
